Comments	Incinerators rely on a constant stream of combustible rubbish. Although they seem an attractive option to reduce landfill they cause air pollution, traffic congestion from the delivery lorries into the long term

Incinerators rely on a constant stream of combustible rubbish. Although they seem an attractive option to reduce landfill they cause air pollution, traffic congestion from the delivery lorries into the long term future. By building incinerators we reduce the impetus to reduce, reuse, repair and recycle. This incinerator will happen local people, increase traffic, lead to worsening air pollution and continue our thoughtless over use of materials. Instead we must work much harder on stopping refuse at source. Remove excess packaging, develop recycling loops for packaging, invest in green waste hot composting and food waste collection schemes. We need Central government action to prohibit certain mixed materials, which can't be recycled, from being used in packaging. Given sufficient education and explanation we in the UK could reduce our waste stream by 50-70%. Our finite planet can't cope with our current thoughtless approach to previous resources. So although this incinerator appears to solve some problems it will cause others and is based on a "business as usual" view of the future which completely failed to acknowledge the Climate Emergency. It should not be built.
